

Endless Frontier: Vannevar Bush, Engineer of the American Century

As a young professor at MIT in the 1920s, Vannevar Bush (1890-1974) did seminal work on analog computing and was a cofounder of Raytheon, whose initial success was based on long-lasting radio tubes. But he is best known for his role in Washington during World War II: as President Roosevelt's advisor, he organized the Manhattan Project and oversaw the work of 6,000 civilian scientists designing new weapons. His 1945 report *Science -- The Endless Frontier* spurred the creation of a system of public support for university research that endures to this day. Although he helped to give rise to the military-industrial complex, Bush was a skeptical observer of the interplay between science and politics. He warned against the dangers of an arms race and led a failed effort to halt testing of the hydrogen bomb. This balanced and gracefully written biography brings to life an American original and his times.
